Constructing the model
We recommend using a double-sided tape for fastening.
1. Cut all edges of the model.
2. Crease all overlapping widths. All are convex folds.
   You can fold paper more neatly if you use a ruler.
3. Apply a double-sided tape or glue to overlapping widths.
4. Insert the white overlapping widths under each adjacent Earth surface, starting from the Arctic region (upper left of model) and ending with the Antarctic region (lower left of model).

Be careful not to cut yourself when using a cutter or scissors!!
